

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (original) A combination of a multiple disk drive storage apparatus and a plurality of removable disk drive modules, the disk drive storage apparatus includes a housing having an opening in a front side that is further divided into a plurality of slots and a motherboard disposed within the housing, each of the disk drive modules is received in one of the slots of the housing, wherein each of the disk drive modules comprises:

a disk drive having a first connector that is received by a second connector of the motherboard when the disk drive module is placed in the slot;

a carrier body with a front portion and a rear portion, the front portion being disposed in the opening in the front side of the housing and the rear portion being disposed within the housing when the disk drive module is placed in one of the slots, a latch integrally formed on the carrier body that engages the housing and is accessible from the front side of the housing, the carrier body having an integrally formed ejection spring that engages a member disposed within the housing; and

wherein the disk drive module may be removed by disengaging the latch from the housing, the ejection spring exerting a biasing force on the member disconnecting the first connector from the second connector and urging the disk drive module out of the housing through the opening in the front side of the housing.

2. (original) The combination of claim 1 wherein the disk drive is a small form factor disk drive.

3. (original) The combination of claim 1 wherein the ejection spring is disposed proximate the rear portion of the carrier body.

4. (original) The combination of claim 1 wherein the member is a portion of the motherboard.

5. (original) The combination of claim 1, wherein the carrier body further comprises a front wall that spans at least a portion of the opening in the front side of the housing, wherein the front wall restricts the flow of air through the opening and seals the multiple disk drive storage apparatus for air flow retention.

6. (original) The combination of claim 1, wherein the carrier body further comprises a side wall having a surface for receiving an informational overlay.

7. (original) The combination of claim 1, wherein the carrier body further comprises:

a light pipe integrally formed on the carrier body, the light pipe extending from the rear portion of the carrier body to the front portion of the carrier body;
the motherboard having at least one status light,
the light pipe being aligned with the status light; and
wherein the light pipe transmits light from the status light to the front portion of the carrier body when the disk drive module is placed in the slot.

8. (original) The combination of claim 1 wherein the carrier is molded in one piece.

9. (original) The combination of claim 1 wherein the carrier is molded from a polycarbonate polymer.

10. (original) The combination of claim 1 further comprising a power source for supplying power to the multiple disk drive storage apparatus, wherein the power source is disposed in a modified carrier and is removable from the housing in the same manner as one of the disk drive modules.

11. (currently amended) A disk drive module that is received in a multiple disk drive storage apparatus, the disk drive module comprising:

a disk drive;

a carrier body having an open sided cavity defined by the carrier body, the disk drive being secured within the cavity, the carrier body having an integrally formed ejection spring that exerts a biasing force relative to the multiple disk drive storage apparatus for disconnecting the disk drive from the multiple disk drive storage apparatus; and

wherein the carrier and the disk drive have first and second cooperating surface features that create a snap-fit to retain the disk drive in the cavity.

12. (original) The disk drive module of claim 11, the disk drive has an outer case, and wherein the first surface feature is at least one recess formed in the outer case, the carrier body providing the second surface feature, wherein the second surface feature is at least one protrusion; and wherein each one of the protrusions is received in one of the recesses.

13. (original) The disk drive module of claim 12, wherein the recess is a threaded hole.

14. (original) The disk drive module of claim 11, wherein the carrier body flexes as the protrusion is inserted into the recess and as the protrusion is removed from the recess.

15. (original) In combination, a multiple disk drive storage apparatus and a plurality of removable disk drive modules, the disk drive storage apparatus including a housing having a front side and a motherboard disposed within the housing, the motherboard having at least one light emitting member, wherein each of the disk drive modules comprises:

a disk drive;

a one piece molded carrier body that at least partially encloses the disk drive, the carrier body having a front portion and a rear portion, the front portion being disposed in the front side of the housing and the rear portion being disposed within the housing when the disk drive module is placed in the housing, a light pipe integrally formed as part of the carrier body that extends from the rear portion of the carrier body to the front portion of the carrier

body, the light pipe being disposed adjacent the light emitting member inside the housing and transmitting light to the front portion of the carrier body.

16. (original) The combination of claim 15 wherein the light emitting member is a light emitting diode.

17. (original) The combination of claim 15 wherein the light emitting member is a status light that indicates an operational condition of the disk drive as detected by the motherboard.

18. (original) The combination of claim 15 wherein the carrier is molded from a polycarbonate polymer.
